### ABSTRACT

**Objective:** The aim of present study was to evaluate the acute toxicity of Mandoora Bhasma in mice.

**Material and Method:** In this study the three doses i.e 0.65 mg / 20 gm, 3.25 mg / 20 gm & 6.5 mg / 20 gm of Mandoora Bhasma was administered orally for 14 days. The equivalent human doses are 250 mg, 1.25 gm and 2.5 gm respectively. The maximum dose administered was 10 times the therapeutic dose.

**Result:** The oral administration of Mandoora Bhasma at the highest dose (10 times) of Therapeutic dose) resulted in no mortalities or evidence of adverse effects implying that Mandoora Bhasma is non toxic. Throughout 14 days of the treatment no hyperactivity, depression or abnormal behavior was seen. Urine output of test group animals was comparable to control group of animals & was normal. Also, there was no cyanosis, blanching or Inflammation of nasal tips, paws, eyes, and ears, no abnormal secretion from mouth, eyes & nose was seen.

**Conclusion:** Overall, the results suggest that, the oral administration of Mandoora Bhasma did not produce any significant toxic effect in mice

**Keywords:** Mandoora Bhasma, Acute Toxicity, body weight, depression etc.
